Ambient yeast fermentation

The conversion of sugars to alcohol, carbon dioxide and other complex flavor compounds via yeast cells present on grape skins at the time of harvest. These natural yeast cells are found everywhere – from the soil to the vines to the winery – and all contribute to a given wine's terroir. Wines that experience ambient yeast fermentation do not have added lab-bred strains of yeast to kick-start or speed up fermentations at any point. Also referred to as *natural fermentation*, *native yeast fermentation* or *spontaneous fermentation*.

Amphora

A clay fermentation vessel with thick, self-regulating temperature walls (generally cone-shaped). The type of clay used to produce amphora vessels will vary on the place they are produced.

Ancestral method

The original method of producing sparkling wine in which the primary fermentation is stopped before completing and a secondary fermentation occurs in the bottle, ending when the yeast cells and supply of residual sugars is depleted. During this process in the bottle, carbon dioxide is trapped and dissolved by the liquid in the bottle, yielding a sparkling wine.

Biodynamic viticulture

A form of organic viticulture that balances the interaction between man, earth, stars and vines. All the various tasks, from planting, pruning, to harvesting, are regulated by a special biodynamic calendar. The calendar is divided into four categories: Root (ideal days for pruning), Fruit (ideal days of harvesting), Flower (days in which the vineyard should be left untouched) and Leaf Days (ideal days for watering vines).

Carbonic maceration

A type of rapid, whole berry fermentation carried out in a sealed container where carbon dioxide cannot escape. Wines created without oxygen generally have minimal tannin and color while expressing juicy fruit flavors.

Concrete tank

A concrete fermentation vessel with thick, self-regulating temperature walls (generally egg-shaped).

Cryomaceration

A winemaking technique in which crushed grapes are held at a low temperature before fermentation in order to allow flavor extraction from the skins and seeds.

Dosage

Step in the traditional method of sparkling wine production following disgorgement where bottles are topped up (the replacement of lost wine in a bottle or barrel in order to limit contact with oxygen) with a mix wine and sugar.

Hand-harvested

Gathering of ripe grapes without machinery for processing into wine.

Low intervention viticulture

A method of viticulture in which minimal chemical inputs (generally via sprays) are added to nourish and/or protect the soil/vines/fruit and vines are minimally trained/pruned in the vineyard system.

Minimally filtered

Wine with minimal filtration. The wine may be moved through filter pads or a mesh sieve via hand or power pumps. The wine may also experience racking (a method in wine production of moving wine from one vat or barrel to another to remove grape sediment, dead yeast cells and other large particle precipitates).

Malolactic fermentation

A bacterial conversion – technically not a fermentation – of malic to lactic acid. Tart malic acid is converted to creamier lactic acid, thus reducing acidity in wine. Carbon dioxide, diacetyl and acetic acid are some of the byproducts of this chemical conversion.

Neutral Oak

An oak barrel that has been used frequently enough that it does not impart any flavor on wines during fermentation or *élevage*.

Non-disgorged

A sparkling wine that has not been disgorged. Disgorgement is a step in the traditional method of sparkling winemaking where a plug comprised of dead yeast cells is removed from the wine.

Organic viticulture

A method of viticulture in which the chemical inputs added to the soil/vines/fruit – if any at all – are natural pesticides and fertilizers. The basic principles of organic farming include crop rotation, green manures and compost, biological pest control, and mechanical cultivation – rather than chemical inputs – to enhance viticultural productivity.

SO₂

Sulfites or SO₂ is a naturally occurring preservative present in grapes before fermentation. Sulfites can also be added to wine to preserve freshness and elongate shelf-life of wines. Wines range from about 10 parts per million (ppm) to 350ppm, legally. Low-intervention wines generally range from about 10 to 40ppm, including natural and added SO₂.

Stainless steel tank

A stainless-steel fermentation vessel (generally cylinder- or cone-shaped).

Tank method

A method of sparkling wine production where the second fermentation takes place under pressure in large steel tanks. Also referred to as *Charmat method*.

Traditional method

A method of sparkling wine production whereby the second fermentation and maturation take place in the same bottle in which the wine is sold. All grower champagne is produced using this method.

Unfiltered

Wine without filtration. The wine is not moved through filter pads or mesh sieves via hand or power pumps. The wine may still experience racking (a method in wine production of moving wine from one vat or barrel to another to remove grape sediment, dead yeast cells and other large particle precipitates). Bottles of wine may be cloudy or have sediment when they are unfiltered.

Unfined

Wine without fining. There are zero substances (fining agents) added to the wine in order to create an adsorbent, enzymatic or ionic bond with the suspended particles, producing larger molecules that will precipitate out of the wine more readily and rapidly. Bottles of wine may be cloudy or have sediment when they are unfined.

Viticulture

A branch of the science of horticulture, viticulture is the process of grape growing for the purpose of making wines. Viticulture includes cultivation practices and harvesting methods.

Zero-input viticulture

A method of viticulture in which organic material from the soil is used to farm the vineyards, the soil is not tilled, vines are minimally pruned, and zero chemical inputs are added to the vineyard system.
